Introduction

As an ultra micro-sized version of the Blade® CX/CX2, the Blade mCX offers first-time pilots the ability to learn how to fly with ease and experienced heli pilots the ability to fly anywhere, anytime. The Blade mCX offers unsurpassed stability and incredible control through the coaxial, counter-rotating head design and Spektrum™ 2.4GHz DSM2™ technology. And, thanks to its rotor span of just 7.5 inches and one ounce flying weight, the Blade mCX can be flown indoors almost anywhere—from an office to a small bedroom or living room.

The Blade mCX comes 100% factory-assembled, flight-tested and ready to fly right out of the box—no assembly or setup required. Included in the box is the LiPo flight battery and convenient AA battery-powered DC LiPo charger, 4-channel transmitter equipped with Spektrum 2.4GHz DSM2 technology, and 8 AA batteries (4 for the transmitter, 4 for the charger). The DSM2 technology offers freedom from frequency restrictions and allows the Blade mCX to be flown anywhere, anytime with full 4-channel control.

And although the Blade mCX is ready-to-fly right from the box, please take the time to read through this manual for tips on battery safety and charging, control checks and more before making your first flight. We also suggest viewing the Instructional Video located on the product page for the Blade mCX on www.e-flite.com.

Warning

An RC helicopter is not a toy! If misused, it can cause serious bodily harm and damage to property. Fly only indoors, in open areas following all instructions and as recommended in this manual. Keep loose items that can get entangled in the rotor blades away from the main and tail blades, including loose clothing, or other objects such as pencils and screwdrivers. Especially keep your hands away from the rotor blades.
• Never operate the model out into the street or populated areas for any reason.

• Carefully follow the directions and warnings for this and any optional support equipment (chargers, rechargeable battery packs, etc.) that you use.

• Keep all chemicals, small parts and anything electrical out of the reach of children.

• Moisture causes damage to electronics. Avoid water exposure to all equipment not specifically designed and protected for this purpose.

• Never lick or place any portion of your model in your mouth as it could cause serious injury or even death.

FCC Information

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Caution: Changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate the equipment.

This product contains a radio transmitter with wireless technology which has been tested and found to be compliant with the applicable regulations governing a radio transmitter in the 2.400 GHz to 2.4835 GHz frequency range.

The associated regulatory agencies of the following countries recognize the noted certifications for this product as authorized for sale and use:

Additional Equipment

No additional equipment is required to complete your Blade mCX.

Preparing for the First Flight Checklist

Please note this checklist is not intended to be a replacement for the content included in this instruction manual. Although it can be used as a quick start guide, we strongly suggest reading through this manual completely before proceeding.

• Remove and inspect contents
• Install four of the included AA batteries in the charger
• Begin charging the flight battery
• Install the remaining four AA batteries in the transmitter

Flying Checklist

Please note this checklist is not intended to be a replacement for the content included in this instruction manual. Although it can be used as a quick start guide, we strongly suggest reading through this manual completely before proceeding.

• Always turn the transmitter on first
• Plug the flight battery into the lead from the 5-in-1 control unit
• Allow the 5-in-1 control unit to initialize and arm properly
• Fly the model
• Land the model
• Unplug the flight battery from the 5-in-1 control unit
• Always turn the transmitter off last

Battery Warnings and Guidelines

While the 1S 3.7V DC Lithium Polymer Battery Charger (EFLC1103) included with your Blade® mCX has been specifically designed to safely charge the included 1S 3.7V 110mAh Lithium Polymer Battery (EFLB1101S), you MUST read the following safety instructions and warnings before handling, charging or using the LiPo battery.

Note: Lithium Polymer batteries are significantly more volatile than the alkaline, NiCd or NiMH batteries used in RC applications. All instructions and warnings must be followed exactly. Mishandling of LiPo batteries can result in fire.

By handling, charging or using the included LiPo battery you assume all risks associated with lithium batteries. If you do not agree with these conditions, return your complete Blade mCX model in new,
LiPo cells should not be discharged to less than 3V each under load.
In the case of the 1S LiPo battery used for the Blade® mCX, you will not want to allow the battery to fall to below 3V during flight.

The Blade mCX’s 5-in-1 control unit features a soft low voltage cutoff (LVC) that occurs when the battery reaches 3V under load. When the soft cutoff occurs, the ESCs of the 5-in-1 unit will reduce power to the motors (regardless of the power level you have set with the throttle stick) in order to prevent the voltage of the battery from dropping below 3V. This reduction in power usually requires that you land the model immediately, at which point you should power down the model and unplug the flight battery.

And while it is possible to power the model up and to fly again after the soft LVC occurs, this is NOT recommended as continued discharging to the soft LVC will cause permanent damage to the LiPo battery that results in lost power and duration when using the battery for subsequent fights, or failure of the battery entirely. Continued attempts to further discharge the battery may also result in loss of control while the motors are running as the voltage of the battery may drop below the minimum operating voltage of the receiver and other electronics.

Also, it is not recommended that you fly to the soft LVC every time you fly. Instead, you should be aware of the power level of the battery/helicopter throughout the flight, and if at any time the helicopter begins to require more throttle than typical to maintain hover or flight, you should land the helicopter immediately. Routinely discharging the battery to the soft LVC can still cause permanent damage to the battery.

Note: When the battery power/voltage is getting low you will typically find that significant rudder trim and/or rudder stick adjustments are needed to prevent the helicopter from spinning. This usually occurs before soft LVC, and indicates a good time to stop flying.

If you have any further questions or concerns regarding the handling, charging and/or use of the included LiPo battery pack, please contact the Horizon Support Team at 877-504-0233.
Battery Charging

It is important that you only charge the included 1S 3.7V 110mAh LiPo Battery (EFLB1101S) with the included 1S 3.7V DC LiPo Charger (EFLC1003). Attempting to charge the battery using another LiPo charger or non-LiPo compatible charger could result in serious damage. Please familiarize yourself thoroughly with the Battery Warnings and Guidelines section before continuing.

Please follow these steps to charge the LiPo battery with the included charger:

- Remove the cover on the bottom of the charger and install four of the included AA batteries, noting proper polarity. Replace the cover after the AA batteries are installed.

- Slide the battery into the slot on the charger. The endcap of the battery has been specifically designed to allow the battery to be slid into the slot easily one way (usually with the label on the battery facing outward) to prevent reverse polarity connection. However, please be sure to check for proper alignment and polarity before proceeding to the next step.

- Gently press the battery and its connector into the charge jack/connector located at the bottom of the slot on the charger. Again, be sure to check for and to achieve proper polarity before making the connection.

- After you make the connection successfully, the LED light on the charger will turn solid red, indicating that charging has begun.

- It will take approximately 30–40 minutes to charge a fully discharged (not over-discharged) battery. As the battery nears full charge, the LED light will begin to blink. When the battery is fully charged the LED light will blink approximately every 20 seconds or will go out entirely.

  Note: The LiPo battery included with your Blade mCX will arrive partially charged. For this reason the initial charge may only take 15–20 minutes.

  Note: You can expect to charge the LiPo flight battery approximately 15–20 times before it will be necessary to replace the AA batteries in the charger. Replacing the included batteries with alkaline batteries will extend the AA battery life.

Installing the Transmitter Batteries

Install four of the included AA batteries in the transmitter. Check for proper operation of the transmitter by switching the power switch on (to the left). The LED light at the top of the transmitter should begin to glow solid red while the transmitter beeps.

Installing the Flight Battery

Once the LiPo battery has been fully charged, it's ready to be installed in the helicopter.

Install the battery in the helicopter by sliding it into the battery mounting supports/slots just below the main gears. Slide the battery into the slots with the label facing downward and the connector oriented toward the back of the helicopter.

Note: Be sure to slide the battery into the slots until the endcap of the battery comes into contact with the rear battery support. This will allow you to achieve the correct center of gravity for the best overall flight performance. However, also be sure that the battery is not pushed far enough forward that it will make contact with the servo gears as this could cause damage to the gears and a potential crash.
Transmitter Control Identification

Note: Each time before you fly you should ALWAYS turn the transmitter on before connecting the flight battery to the 5-in-1 unit. After each flight, be sure that you always disconnect the flight battery from the 5-in-1 unit before powering the transmitter off.

Control Test

Although each Blade mCX model is test flown at the factory, it is a good idea to test the controls prior to the first flight to ensure none of the servos, linkages or parts were damaged during shipping and handling.

Turn the transmitter on first and lower the throttle stick completely. Then, plug the battery into the battery lead of the 5-in-1 unit.

Note: The connectors on the battery and battery lead are keyed to prevent reverse polarity connection. However, if you force them together in the wrong orientation and with the wrong polarity it is still possible to damage the battery and/or 5-in-1 unit. To help further prevent a reverse polarity connection, one side of the endcap on the battery and the connector on the battery lead of the 5-in-1 unit will have a red dot. The connectors are oriented for a proper polarity connection when the red dots are on the same side (usually toward the top of the helicopter).
Move the elevator stick on the transmitter forward and aft to check elevator pitch control. When the stick is pushed forward, the right-hand servo (when viewing the helicopter from behind) should pull the swashplate downward.

With the stick pulled back, the right-hand servo should push the swashplate upward.

Move the right-hand stick left and right to check aileron roll control. When the stick is pushed to the left, the left-hand servo (when viewing the helicopter from behind) should pull the swashplate downward.

With the stick pushed right, the left-hand servo should push the swashplate upward.

If at any time during the test the controls respond in the opposite direction, it may be necessary to reverse/change the direction of operation of the flight controls. Follow these steps to change the direction of the various flight controls:

- Be certain that the battery is disconnected from the battery lead of the 5-in-1 control unit and the transmitter is turned off.
- Push down on the appropriate digital trim button on the transmitter for the control you would like to reverse. For example:
  - Top elevator trim button—elevator channel normal (correct for Blade mCX)
  - Bottom elevator trim button—elevator channel reversed
  - Left aileron trim button—aileron channel normal (correct for Blade mCX)
  - Right aileron trim button—aileron channel reversed
- Continue to hold the appropriate trim button while turning the transmitter on.
- Hold the digital trim button down for approximately five seconds, until a series of beeps/tones are heard confirming the selection.
- Connect the battery to the 5-in-1 and complete the flight control test, confirming that all controls are operating in the correct directions.

Once you've reconfirmed the flight control directions, all controls should be functioning properly. However, if you continue to encounter any problems with your Blade mCX responding properly to the transmitter, do not fly. Call the Horizon Support Team at 1-877-504-0233.
After confirming that the transmitter has been turned on and that the LED is glowing solid red, it is now safe to connect the flight battery to the 5-in-1 unit.

Note: It is extremely important that you do not move or sway the helicopter once you connect the flight battery. If you do move the helicopter while the 5-in-1 is initializing, disconnect the flight battery from the 5-in-1 unit and repeat the initialization process.

- When the status LED becomes solid red, the 5-in-1 unit is initialized and ready for flight. Also, as long as you had the throttle stick and trim set the correct positions during the initialization process, the ESCs/motors will now be armed. Use caution as both rotor blades will now spin with throttle stick input.

Note: If the status LED does not become solid red, please review the following:

- If after blinking red the status LED becomes solid red, but you have no control of the motors, you have a positive Radio Frequency (RF) link between the transmitter and receiver, but the throttle stick and throttle trim may not be set to the correct positions. Check to be sure that the throttle stick is in the lowest possible position, and that the throttle trim is set to the middle position or lower than the middle position. If you now have control of the motors, proceed to the next step of the checklist.

- If the blinking red status LED keeps flashing, you do not have a positive RF link between the transmitter and receiver. Check to be sure that the transmitter has been powered on and that the LED indicator on the transmitter is glowing solid red. If the transmitter is powered on and functioning properly, disconnect the flight battery from the 5-in-1 unit, then reconnect it. Now the 5-in-1 unit should initialize and arm properly.

Note: In the event you inadvertently enter Bind Mode, the LED will be flashing red continuously. If this occurs, cycle flight battery while the transmitter is on (if previously bound).

If your 5-in-1 unit will not initialize and arm after following the guidelines as listed above, call the Horizon Support Team at 1-877-504-0233.
• Once you have placed the helicopter in a safe area, free of obstructions, and are clear of the rotor blades, you can safely begin to power up the model to check for proper operation of the motors.

• Advance the throttle stick upward slowly, just until both rotor blades begin to spin. **DO NOT attempt the fly the helicopter at this time.** Note the direction that each of the rotor blades spins. When viewed from the top, the upper main rotor blades should spin counter clockwise and the lower main rotor blades should spin clockwise. If either set of rotor blades is operating in the wrong direction, disconnect the battery and reverse the polarity of the corresponding motor’s input power leads.

• After confirming that the direction of rotation for both rotor blades is correct, it is best to confirm that both rotor blades respond properly to rudder control inputs.

With the rotor blades spinning at a low level of power, move the rudder (left-hand) stick all the way to the right. This should cause the speed of the upper main rotor blade to increase, and the speed of the lower main rotor blade to decrease.

Next, move the rudder stick all the way to the left. This should cause the speed of the lower main rotor blade to increase and the speed of the upper main rotor blade to decrease. If both rotor blades are not responding properly to rudder input, simply swap the locations of their motor plugs on the 5-in-1 unit.

After confirming that both rotor blades are rotating in the correct directions, and are responding properly to rudder inputs, your Blade mCX is ready for flight. However, please be sure to review the following sections of the manual BEFORE proceeding with the first flight.

---

**Understanding the Primary Flight Controls**

If you are not familiar with the controls of your Blade mCX, please take a few minutes to familiarize yourself with them before attempting your first flight.

When the throttle stick is in the lowest possible position and throttle trim is set to the middle or a lower than the middle position, the main rotor blades will not spin. Advancing the stick upward will increase the speed of the main rotor blades. Increasing the speed of the main rotor blades will cause the model to climb.

Decreasing the speed of the main rotor blades by lowering the throttle stick will cause the model to descend.

After lifting the model off the ground you can balance the throttle by carefully moving the throttle stick up and down so the model will hold a stationary hover without climbing or descending.
The elevator stick controls pitch fore/aft. Pushing the stick forward will pitch the nose of the helicopter downward, allowing the helicopter to be flown forward.

Moving the left-hand stick to the left will turn (yaw) the nose of the helicopter to the left about the axis of the main shaft. This is accomplished by increasing the speed of the lower main rotor blade while decreasing the speed of the upper main rotor blade.

Moving the stick to the right will turn (yaw) the nose of the helicopter to the right about the axis of the main shaft. This is accomplished by increasing the speed of the upper main rotor blade while decreasing the speed of the lower main rotor blade.

The rudder trim can be used to help keep the nose of the helicopter from rotating to the left or right when in hover with no rudder stick input. For example, if the nose of the helicopter drifts to the right when in hover, add left rudder trim (by pressing the left rudder trim button) until the nose stays as close to straight as possible.

The elevator trim can be used to help keep the helicopter from drifting forward or backward when in hover with no elevator stick input. For example, if the helicopter drifts forward when in hover, add back/up elevator trim until the helicopter hovers as level as possible with no forward drifting.

Moving the aileron stick to the left will roll the helicopter to the left, allowing the helicopter to be flown to the left.

Pulling the stick backward will pitch the tail of the helicopter downward, allowing the helicopter to be flown backward.

Moving the stick to the right will turn (yaw) the nose of the helicopter to the right about the axis of the main shaft. This is accomplished by increasing the speed of the upper main rotor blade while decreasing the speed of the lower main rotor blade.
Moving the aileron stick to the right will roll the helicopter to the right, allowing the helicopter to be flown to the right.

The aileron trim can be used to help keep the helicopter from drifting left or right when in hover with no aileron stick input. For example, if the helicopter drifts to the right when in hover, add left aileron trim until the helicopter hovers as level as possible with no drifting to the right.

Once you're familiar with the primary controls of the helicopter, you are almost ready to fly.

---

**Dual Rates**

The MLP4DSM transmitter included with your Blade mCX is equipped with a dual rate feature. This feature allows the pilot the toggle between the high and low control rates available for the aileron, elevator and rudder channels. You can toggle between the high and low rates by pushing in on the right-hand stick on the transmitter (while the transmitter is powered on). You will hear and feel a click when you have pushed in on the stick to activate this feature.

When the transmitter is first powered on it will be in the high rate mode. You can tell you are in the high rate mode when the LED on the transmitter glows solid red. In the high rate mode the controls are allowed to reach their maximum values, which is typically preferred by experienced pilots interested most in maximum control authority.

By pushing in on the right-hand stick while in the high rate mode you can enter the low rate mode. You can tell you are in the low rate mode when the LED on the transmitter blinks continuously. The low rate mode is typically preferred by (and best for) first-time, low-time and other pilots interested most in a reduced amount of control that allows for smoother and more easily controlled hovering and flying.

*Note: The throttle curve in the low rate mode is also different than it is in the high rate mode. This makes it much smoother and easier to control the throttle when in the low rate mode.*

---

**Choosing a Flying Area**

When you are ready for your first flight, you will want to select a relatively open indoor area that is free of people and obstructions. And while it is possible for experienced pilots to fly the Blade mCX in relatively small indoor areas with great success due to its size and controllability, we strongly recommend an area with at least 10-feet by 10-feet of floor space and no less than 8-foot ceilings when making your first few flights.

Once you have properly trimmed your helicopter and become familiar with its handling and capabilities, you will be able to fly in other smaller, less open areas.

*Note: The Blade mCX is designed and intended to be flown INDOORS ONLY.*
Flying the Blade mCX

Having followed the proper 5-in-1 control unit initialization and arming procedures, confirmed proper control of the servos and motors, and found a suitable flying area, your Blade mCX is ready for flight.

Note: In addition to reviewing the flight maneuvers outlined below, we recommend that you watch the Instructional Video located on the product page for the Blade mCX on www.e-flite.com to see many of these maneuvers and adjustments performed by the helicopter and pilot.

- Slowly raise the throttle stick, increasing the speed of the main rotor blades until the model begins to lift off. Do not raise the throttle stick too quickly as the model could climb too fast causing you to lose control or make contact with objects above.

- Lift the model off the ground just a few inches and concentrate on balancing the throttle stick position so that the model holds a steady hover altitude. In some cases it may be best to make a few short “hops” to an altitude of just a few inches until you become familiar with the control inputs and trim settings required to maintain a steady hover and altitude.

As you will find, the Blade mCX requires minor throttle adjustments to maintain its altitude in hover. Remember to keep these throttle adjustments as minimal as possible as large adjustments could result in a loss of control and/or a possible crash.

- While attempting to establish a low-level hover, you can also check to see if any trim adjustments are required to help keep the Blade mCX from constantly drifting in various directions. If you find the helicopter constantly drifts without any directional control input, it will be best to land the model before making any adjustments to the trim settings. Additional details regarding the location and function of the trim buttons can be found in the “Understanding the Primary Flight Controls” section of this manual.

If the nose of the helicopter is drifting to the left or right, you will need to adjust the rudder trim.

If the helicopter is drifting forward or backward, you will need to adjust the elevator trim.

If the helicopter is drifting to the left or right, you will need to adjust the aileron trim.

Continue to make trim adjustments until the helicopter can hover at a low altitude with very little drifting and directional control input. If the Blade mCX is your first helicopter model, it may be best to have the help of an experienced helicopter pilot to trim the model for you before making your first flight.

- Once you have the Blade mCX properly trimmed and maintaining a stable low-level hover, practice using the rudder, elevator and aileron controls to get a feel for how the helicopter responds to control inputs. Remember to keep the control inputs as minimal as possible to prevent over-controlling the helicopter, especially when in hover.

After becoming comfortable with hovering the Blade mCX at low-levels of altitude just a few inches off the ground, you can transition to hovering and flying the helicopter at higher altitudes of approximately three to four feet. At these higher altitudes you will be able to get a feel for the flight characteristics of the Blade mCX when it is flying out of “ground effect.”

- If at any time during flight you feel like the helicopter is drifting out of control, simply release all of the controls except for throttle. You will need to use the throttle to maintain altitude, but due to the inherent stability of the coaxial, counter-rotating blade design, the Blade mCX will simply return to a stable hover on its own if space allows.

- Don’t be afraid to set the helicopter down on the ground quickly by lowering the throttle when approaching walls or other obstacles to help prevent main rotor blade strikes.

• IN THE UNFORTUNATE EVENT OF A CRASH OR ROTOR BLADE STRIKE, NO MATTER HOW MINOR OR MAJOR, YOU MUST LOWER THE THROTTLE STICK TO THE LOWEST POSSIBLE POSITION AS QUICKLY AS POSSIBLE TO PREVENT DAMAGE TO THE ESCS OF THE 5-IN-1 UNIT. YOU MUST

**Transmitter and Receiver Binding**

Binding is the process of programming the receiver to recognize the GUID (Globally Unique Identifier) code of a single specific transmitter. If you ever find it is necessary to replace the transmitter or the receiver/5-in-1 unit for your model, it will be necessary for you to ‘bind’ the new transmitter or receiver/5-in-1 to your existing transmitter or receiver/5-in-1 for proper operation.

The following steps outline the binding process:

- Make sure the flight battery is disconnected from the 5-in-1 unit and the transmitter is turned off.
- Plug the flight battery into the 5-in-1 unit. After 5 seconds the LED on the 5-in1 unit will begin flashing.
- PUSH directly down on the left-hand stick while switching the transmitter on (you will feel a ‘click’ when you push in on the end of the stick).
- If you entered bind mode correctly, you will hear a series of beeps from the transmitter and see the LED on the transmitter blink.
- You will see a solid LED approximately 5-10 seconds later on the receiver/5-in-1. You should now be bound to the transmitter, and have full control and function.

If you encounter any problems, repeat the binding process again or call the Horizon Support Team at 1-877-504-0233.

**ALSO BE SURE THAT THE THROTTLE TRIM IS SET TO THE MIDDLE POSITION OR TO A POSITION THAT IS LOWER THAN THE MIDDLE.**

Failure to lower the throttle stick to the lowest possible position in the event of a crash could result in damage to the ESCs in the 5-in-1 unit, which may require replacement of the 5-in-1 unit.

**Note:** Crash damage is not covered under warranty.

- Once you have gained experience and confidence in hovering the Blade mCX, you can attempt more advanced maneuvers including:
  - Forward Flight
  - Backward Flight
  - Pirouettes

Warranty Period

Horizon Hobby, Inc., (Horizon) warranties that the Products purchased (the "Product") will be free from defects in materials and workmanship at the date of purchase by the Purchaser.

Limited Warranty

(a) This warranty is limited to the original Purchaser ("Purchaser") and is not transferable. REPAIR OR REPLACEMENT AS PROVIDED UNDER THIS WARRANTY IS THE EXCLUSIVE REMEDY OF THE PURCHASER. This warranty covers only those Products purchased from an authorized Horizon dealer. Third party transactions are not covered by this warranty. Proof of purchase is required for warranty claims. Further, Horizon reserves the right to change or modify this warranty without notice and disclaims all other warranties, express or implied.

(b) Limitations- HORIZON MAKES NO WARRANTY OR REPRESENTATION,
EXPRESS OR IMPLIED, ABOUT NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OF THE PRODUCT. THE PURCHASER ACKNOWLEDGES THAT THEY ALONE HAVE DETERMINED THAT THE PRODUCT WILL SUITABLY MEET THE REQUIREMENTS OF THE PURCHASER’S INTENDED USE.

(c) Purchaser Remedy- Horizon’s sole obligation hereunder shall be that Horizon will, at its option, (i) repair or (ii) replace, any Product determined by Horizon to be defective. In the event of a defect, these are the Purchaser’s exclusive remedies. Horizon reserves the right to inspect any and all equipment involved in a warranty claim. Repair or replacement decisions are at the sole discretion of Horizon. This warranty does not cover cosmetic damage or damage due to acts of God, accident, misuse, abuse, negligence, commercial use, or modification of or to any part of the Product. This warranty does not cover damage due to improper installation, operation, maintenance, or attempted repair by anyone other than Horizon. Return of any goods by Purchaser must be approved by Horizon before shipment.

Damage Limits

HORIZON SHALL NOT BE LIABLE FOR SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOSS OF PROFITS OR PRODUCTION OR COMMERCIAL LOSS IN ANY WAY CONNECTED WITH THE PRODUCT, WHETHER SUCH CLAIM IS BASED IN CONTRACT, WARRANTY, NEGLIGENCE, OR STRICT LIABILITY. Further, in no event shall the liability of Horizon exceed the individual price of the Product on which liability is asserted. As Horizon has no control over use, setup, final assembly, modification or misuse, no liability shall be assumed nor accepted for any resulting damage or injury. By the act of use, setup or assembly, the user accepts all resulting liability.

If you as the Purchaser or user are not prepared to accept the liability associated with the use of this Product, you are advised to return this Product immediately in new and unused condition to the place of purchase.

Law: These Terms are governed by Illinois law (without regard to conflict of law principals).

Safety Precautions

This is a sophisticated hobby Product and not a toy. It must be operated with caution and common sense and requires some basic mechanical ability. Failure to operate this Product in a safe and responsible manner could result in injury or damage to the Product or other property. This Product is not intended for use by children without direct adult supervision. The Product manual contains instructions for safety, operation and maintenance. It is essential to read and follow all the instructions and warnings in the manual, prior to assembly, setup or use, in order to operate correctly and avoid damage or injury.

Questions, Assistance and Repairs

Your local hobby store and/or place of purchase cannot provide warranty support or repair. Once assembly, setup or use of the Product has been started, you must contact Horizon directly. This will enable Horizon to better answer your questions and service you in the event that you may need any assistance. For questions or assistance, please direct your email to productsupport@horizonhobby.com, or call 877.504.0233 toll free to speak to a service technician.

Inspections or Repairs

If this Product needs to be inspected or repaired, please call for a Return Merchandise Authorization (RMA). Pack the Product securely using a shipping carton. Please note that original boxes may be included, but are not designed to withstand the rigors of shipping without additional protection. Ship via a carrier that provides tracking and insurance for lost or damaged parcels, as Horizon is not responsible for merchandise until it arrives and is accepted at our facility. A Service Repair Request is available at www.horizonhobby.com on the “Support” tab. If you do not have internet access, please include a letter with your complete name, street address, email address and phone number where you can be reached during business days, your RMA number, a list of the included items, method of payment for any non-warranty expenses and a brief summary of the problem. Your original sales receipt must also be included for warranty consideration. Be sure your name, address, and RMA number are clearly written on the outside of the shipping carton.
Warranty Inspection and Repairs

To receive warranty service, you must include your original sales receipt verifying the proof-of-purchase date. Provided warranty conditions have been met, your Product will be repaired or replaced free of charge. Repair or replacement decisions are at the sole discretion of Horizon Hobby.

Non-Warranty Repairs

Should your repair not be covered by warranty the repair will be completed and payment will be required without notification or estimate of the expense unless the expense exceeds 50% of the retail purchase cost. By submitting the item for repair you are agreeing to payment of the repair without notification. Repair estimates are available upon request. You must include this request with your repair. Non-warranty repair estimates will be billed a minimum of ½ hour of labor. In addition you will be billed for return freight. Please advise us of your preferred method of payment. Horizon accepts money orders and cashier’s checks, as well as Visa, MasterCard, American Express, and Discover cards. If you choose to pay by credit card, please include your credit card number and expiration date. Any repair left unpaid or unclaimed after 90 days will be considered abandoned and will be disposed of accordingly. Please note: non-warranty repair is only available on electronics and model engines.

Electronics and engines requiring inspection or repair should be shipped to the following address:

Horizon Service Center
4105 Fieldstone Road
Champaign, Illinois 61822
